4/1/2012 Scan 289 (cont.)

5:08	.0012.med	Mid ol (")	image # 0011	Lo _o = 116.5	
5:20	.0013.med	" (")	0012	116.5	
2531	.0014.med	" (")	0013	116	
0542	.0015.med	" (")	0014	115.5	
0553	.0016.med	" (")	0015	116	
0604	.0017.med	" (")	0016	115.0	
0616	.0018.med	" (")	0017	114.0	
0628	.0019.med	" (")	0018	114.0	
0648	.0020.med	" (")	0019	113.5	
0822	.0021.med	"	0.2, 0.2)	0020		
08	- spending time looking at γ pos'ns for MgO (found); recenter \times , see too much MgO? too						
0900	.0022.med	"	- all same -		image # 0021	108.0	
	- there clearly is MgO in all the 0022.med spectra, including the (100) (maybe) - the teeniest of the big 3 at the left), which sits just at the right shoulder of the olivine 7-8 doublet.						
	- check spot size						
0926	.0023.med	mid ol	(33.55, 33.55, -17.7835, 0.2, 0.2)		image #22	107.0	
-0925	3 - check spot size & actual ol length using press Z: $l_{ol} = 1.13 \text{ mm}$, spot = $160 \times 160 \mu\text{m}$!						
	- however, also note that using "CamSlitY/Z (Width)" indicates a much different size: γ closes completely (= no diff'n) at +0.02; Z at +0.04						
0952	.0023.med	- all same -			#23	106.0	
1017	.0024.med	"			24	105.0	
	5 - refocus camera (might have hit it earlier accidentally)						
1054	.0026.med	- all same -			25	102.5	
	- the slightly higher than expected sl here is probably an artifact of camera refocussing. Can't guess when camera moved out of focus, however.						
1116:30	.0027.med	- all same -			26	101.5	
1128	.0028.med	bottom ol	(34.0, 34.0	—)	27	101.0
1142	.0029.med	mid ol	(33.55, 33.55,	—)	28	100.5
1154	.0030.med	bot ol	(34.0, 34.0	—		29 - spot only!	100.0
1206	.0031.med	mid ol	(—		30 - spot only!	100.00
1217	.0032.med	bot ol	(—		31	99.5
1229	.0033.med	mid ol	(—		32	98.5
